When it comes to handling bulk materials, such as Gypsum, Natural Sandstone, Iron Elements, and Casting Sand... Demag High Performance Double-Girder Open Winch Cranes provide the ultimate solution for these material handling storage needs.

Demag High Performance Cranes are engineered with the priority of feeding the input chute. An example application was to handle approximately 258 tn/h, with bulk material weighing up to 1.2 ton/yard³. With these requirements in mind, Demag engineered two automatically controlled double-girder open winch cranes. Each crane was installed with a visualization system and a warehouse management system. Four-rope clamshell grabs with 6.5 yard³ capacities were used as load attachments.

Demag High Performance Cranes are engineered to meet their specific application. Whether manual or automated, these systems are designed to operate 24/7. In addition to using standard Demag Components, safety and reliability are also key factors that go into the design of every Demag Crane.

Two Demag High Performance Cranes handling additives for the Cement and Lime Industry.
